Let us recap on what we did →

**Data pre-process, clean,
Feature Engineer**

**Model Development
& Train**

Model Tune

**Model
Evaluate**

Experiment

**Brainstorm
to improve**

Data pre-process

- Clubbing data from different data source
- Transforms are reproducible, deterministic and idempotent
- Create and monitor data pipeline for consistency across data sets

Data Cleaning

- Duplicates removals ✓
- Data validity check ✓
- Missing values imputation ✓
- Outliers handling ✓

Feature Engineering

- Feature Creation & Transformations ✓
- Feature Extraction ✓
- Feature Selection ✓

EDA

- Uni-variate analysis ✓
- Bi-variate/Multi-variate analysis ✓
- Pivots ✓
- Visualization and Data Insights ✓

ML model assumption checks

Data Preparation for Modelling

- Creating dummy variables ✓
- Over and Under Sampling (if data is imbalanced) ✓
- Split data into train & test ✓

Model building from list of models available

Model tuning can be done by:

- Cover the Basics of what parameters are involved in the algorithm that is used. }
- Find Your Score Metric
- Obtain Accurate Forecasting Score by Cross Validation
 - ~~Holdout~~
 - K-fold cross validation ✓
- Diagnose Best Parameter Value Using Validation Curves specially for taking care of overfitting and underfitting }

grid
bar

Evaluate models by holistically looking at

- Test Harness: The train test split
- Performance Measure
 - Specific metrics for regression and classification
- Cross-validation: Solving the case of underfitting and overfitting
- Testing Algorithms: Business test logics that needs to looked into

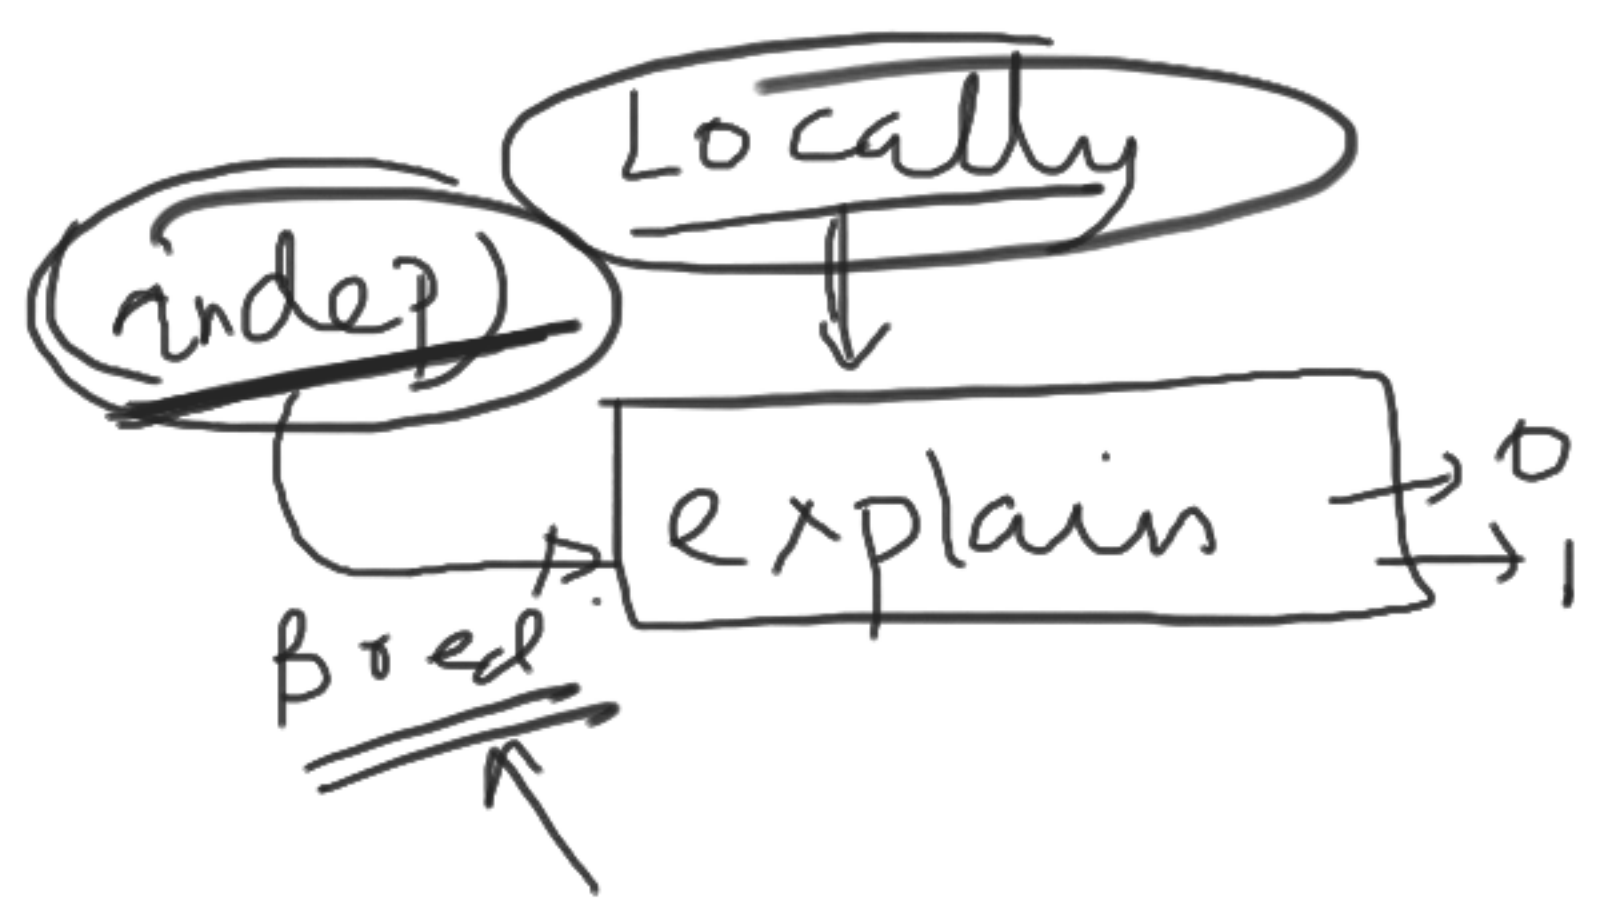

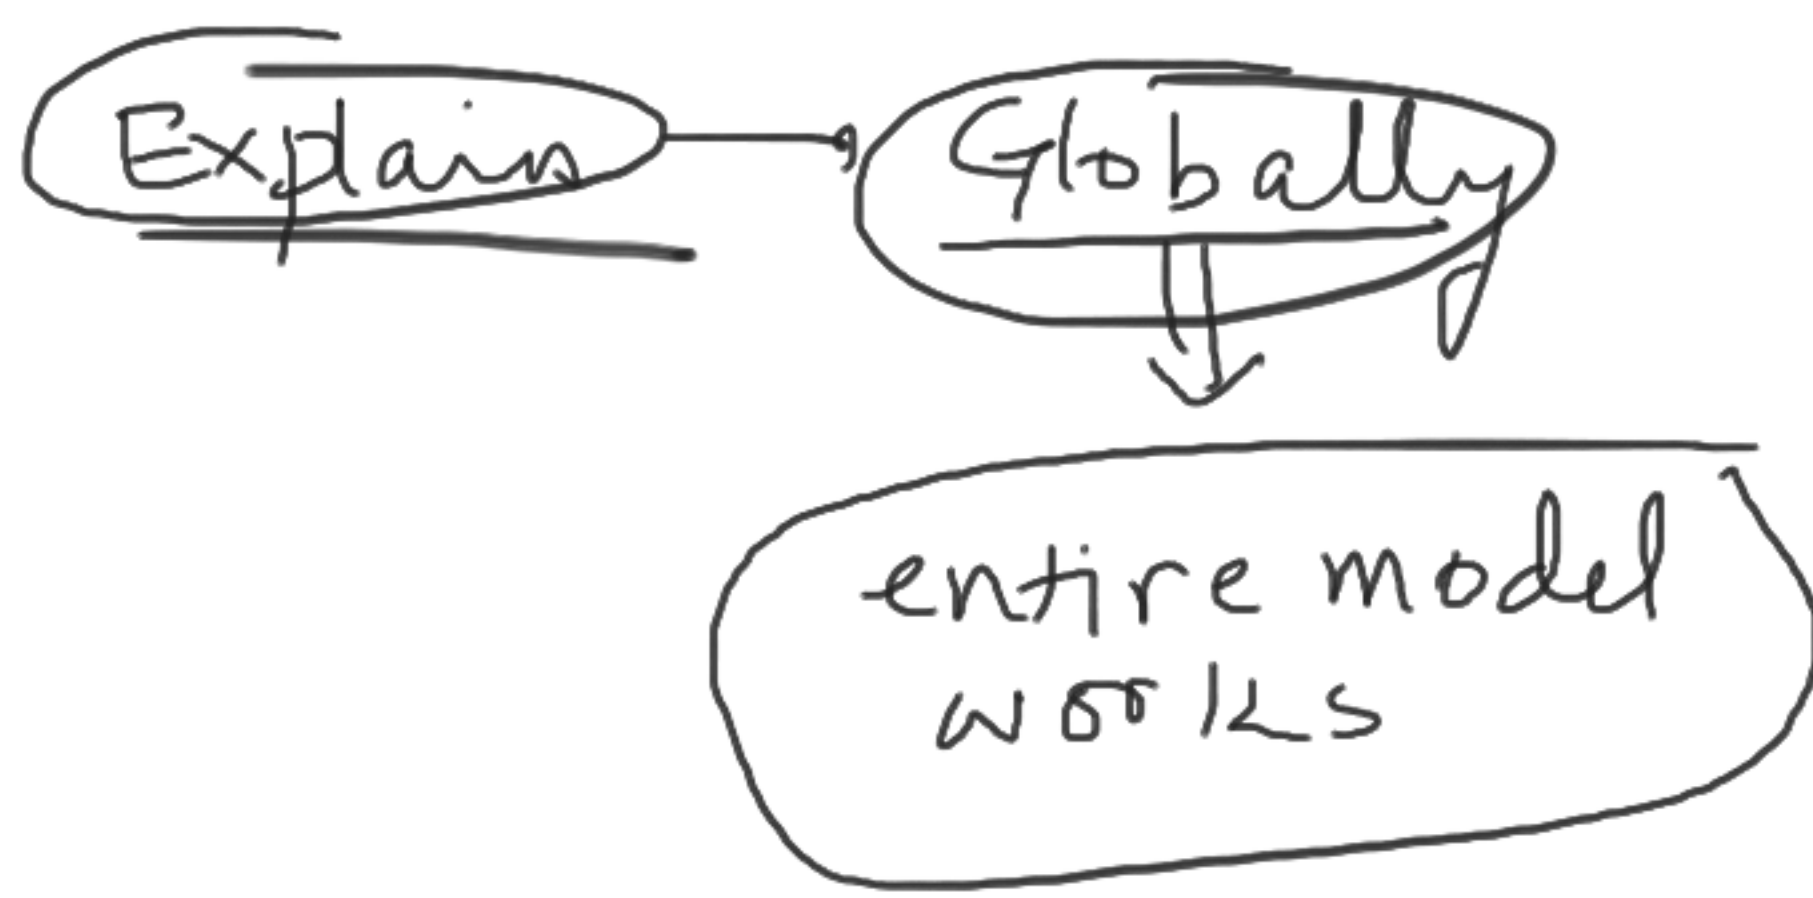

Experiment before launch

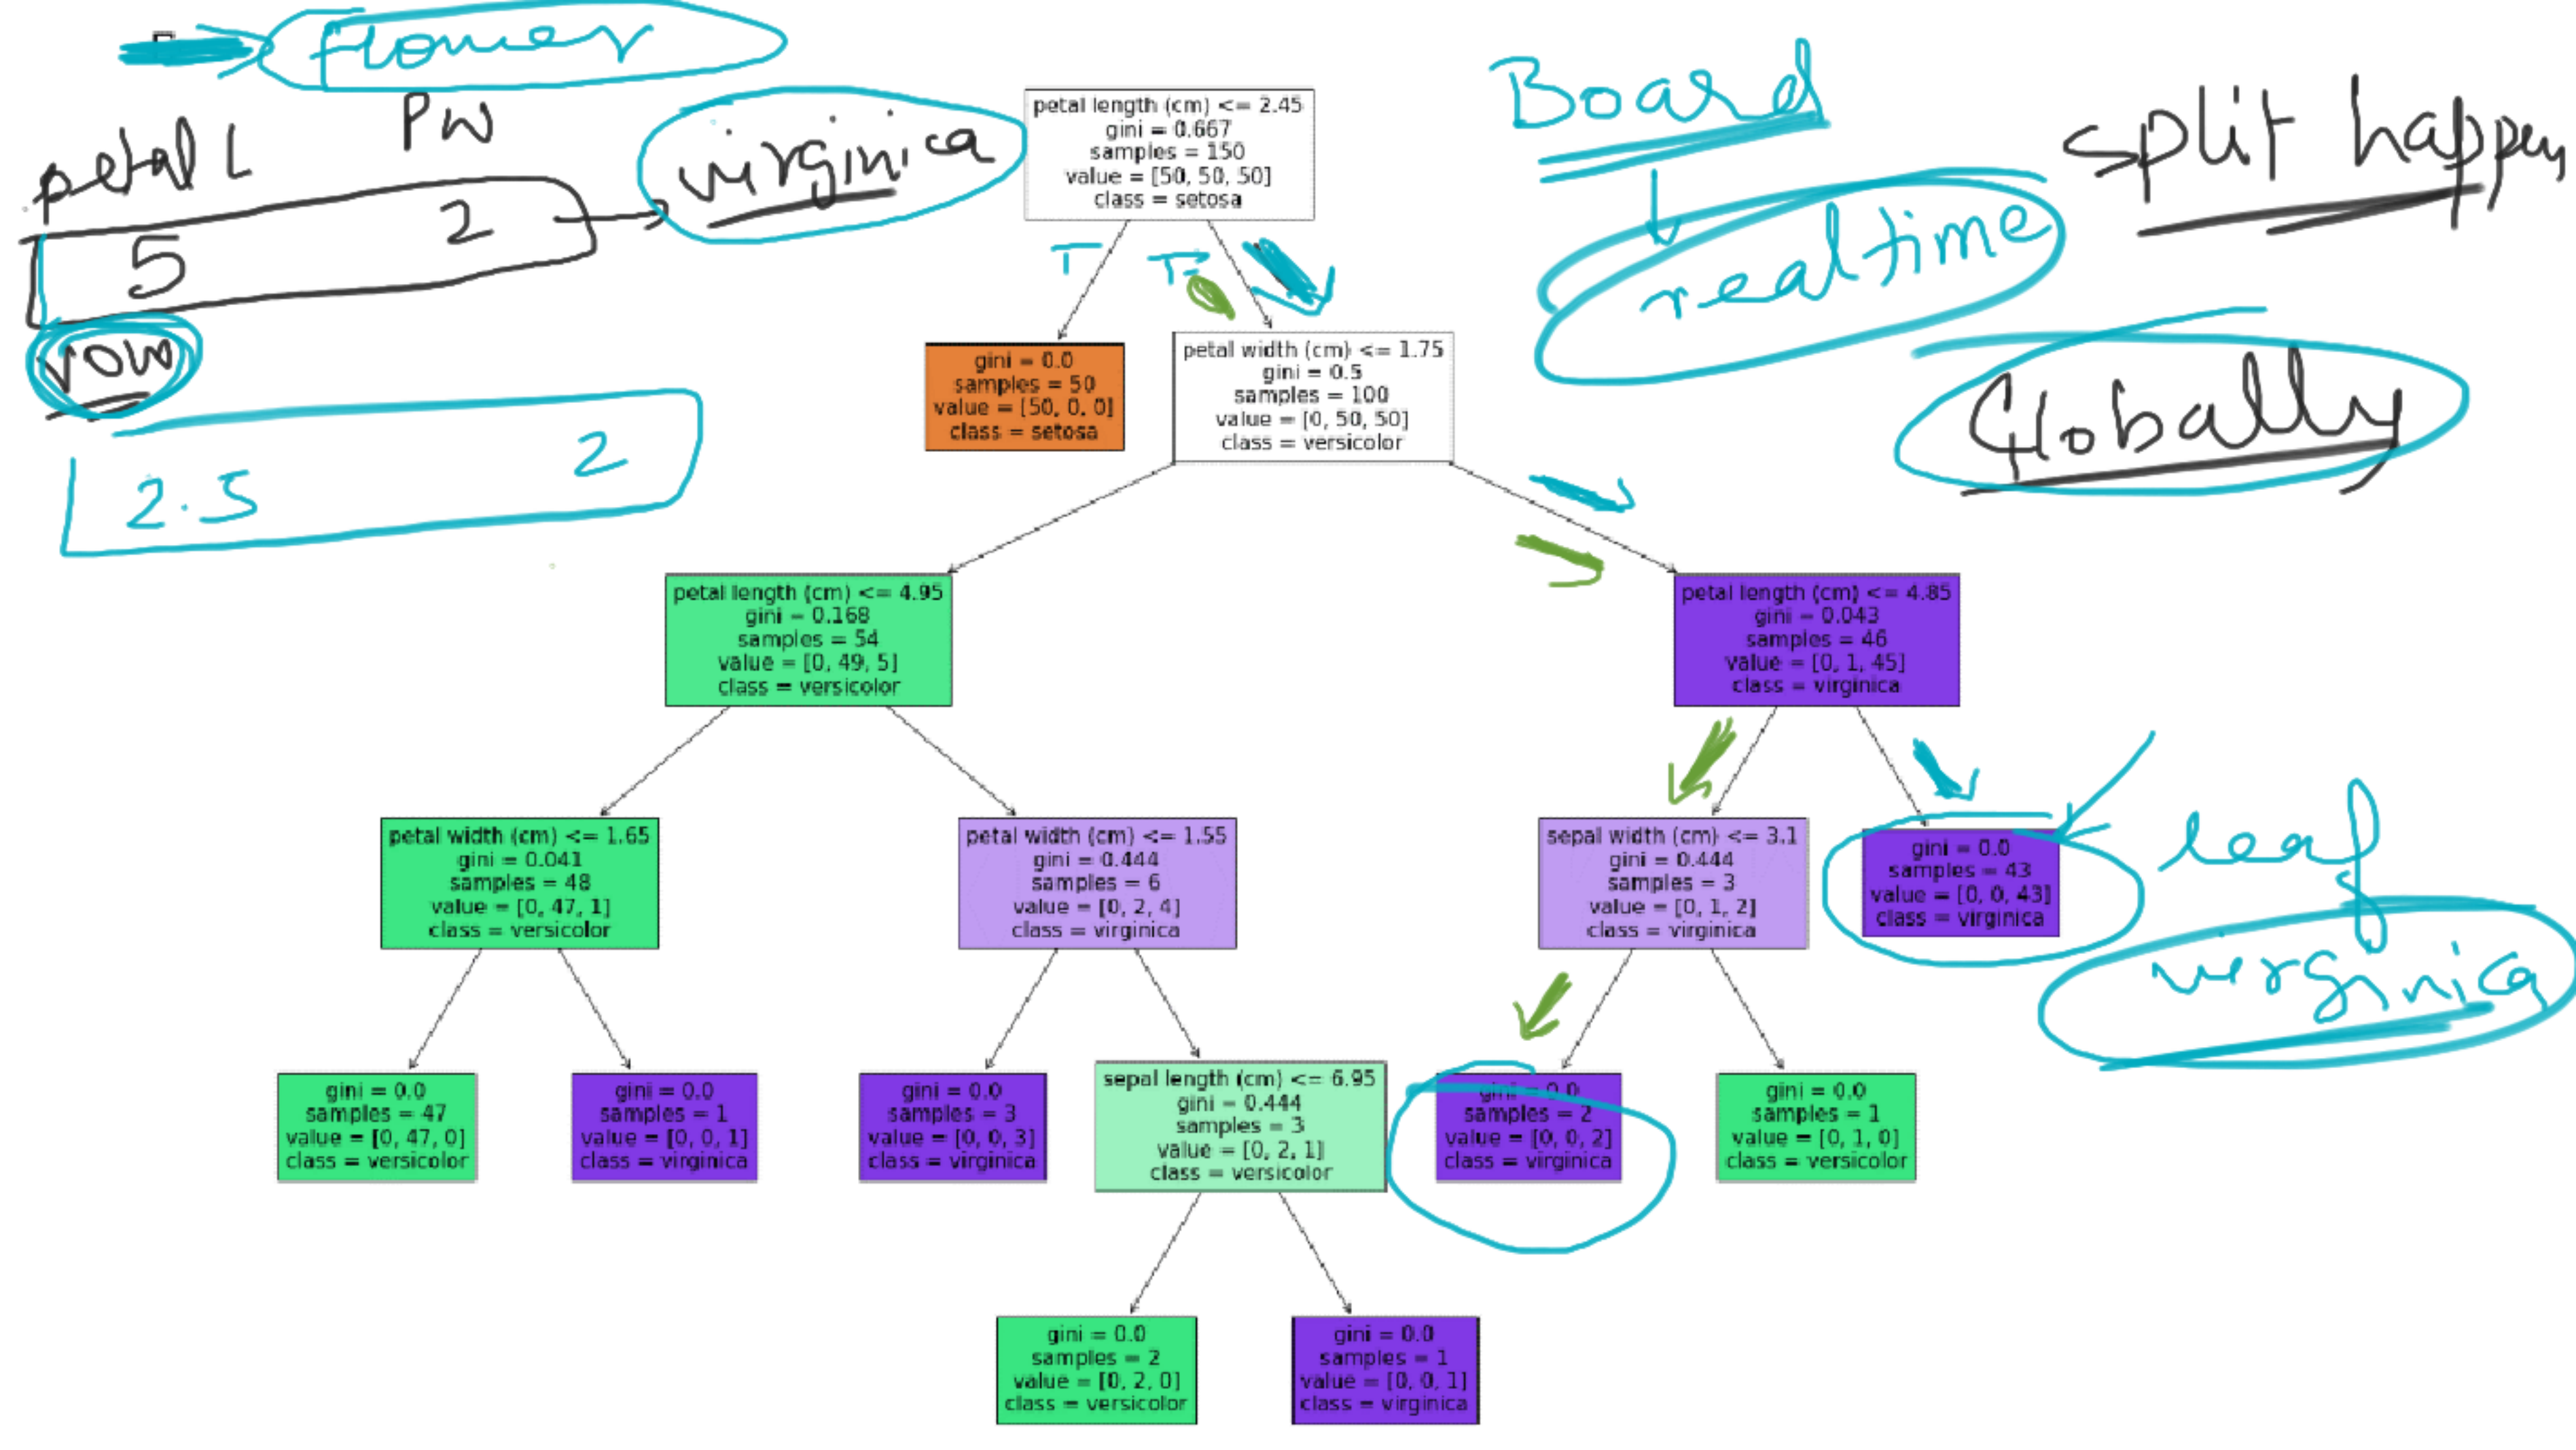

- AB Testing:
 - ~~Frequency~~
 - Bayesian ✓
- Regression Discontinuity Design ✓
- Diff-in-Diff ✓

adu

Experiment before launch

- On the basis of causation that led to the failure of Experiment, corresponding methods are employed and the process restarts from model development and train.
